Blue KC has developed medical policies that serve as one of the sets of guidelines for coverage decisions. Benefit plans vary in coverage and some plans may not provide coverage for certain services discussed in the medical policies. Coverage decisions are subject to all terms and conditions of the applicable benefit plan, including specific exclusions and limitations, and to applicable state and/or federal law. Medical policy does not constitute plan authorization, nor is it an explanation of benefits.

When reviewing for a Medicare beneficiary, guidance from National Coverage Determinations (NCD) and Local Coverage Determinations (LCD) supersede the Medical Policies of Blue KC. Blue KC Medical Policies are used in the absence of guidance from an NCD or LCD.

Policy
There will not be gender dysphoria language in the covered services section unless the group requests it be included or unless the group requests an expanded benefit. If the exclusion is not there, the group does cover the benefit.

Some grandfathered plans may exclude coverage of gender reassignment surgery (sex change surgery, transgender surgery) or any treatment of gender identity disorders. Please verify benefits.

There are three phases to coverage:

1. Phase one is at least 12 consecutive months of living, dressing and working full-time as the preferred gender. During this period coverage will require regular and consistent attendance in a program of counseling and behavior therapy.

2. Phase two begins after phase one and is 12 additional consecutive months of living, dressing and working full-time as the preferred gender with the addition of hormone supplementation consistent with the preferred gender. During this period coverage will require continued regular and consistent attendance in a program of counseling and behavior therapy.

3. After documented completion of phase one and phase two, the requested surgical alteration (phase 3) will be covered subject to non-discriminatory medical policy.
When Policy Topic is covered

Non-Surgical Treatment of Gender Dysphoria

If a plan covers non-surgical treatment for gender dysphoria, the following non-surgical treatments are covered:

- Psychotherapy for gender dysphoria and associated co-morbid psychiatric diagnoses.
  - Note: If mental health services are covered based on the behavioral health services benefit.
- Continuous Hormone Replacement Therapy – Hormones of the desired gender. Hormones injected by a medical provider (for example hormones injected during an office visit) are covered by the medical plan. Benefits for these injections vary depending on the plan design. Oral and self-injected hormones from a pharmacy are not covered under the medical plan. Refer to the Outpatient Prescription Drug Rider, or SPD for self-funded plans, or specific prescription drug product coverage and exclusion terms.
- Eligibility Qualifications for Continuous Hormone Replacement Therapy – The covered person must meet all of the following eligibility qualifications for hormone replacement:
  - Persistent, well-documented gender dysphoria (see definition of Gender Identity Disorder below); and
  - Capacity to make a fully informed decision and to consent for treatment; and
  - Age of majority in a given country. Note: WPATH guidelines address age of majority in a given country. For the purposes of this guideline, the age of majority is age 18. However, this refers to chronological age not biological age. Where approval or denial of benefits is based solely on the age of the individual a case-by-case medical director review is necessary; and
  - If significant medical or mental health concerns are present, they must be reasonably well-controlled.
- Laboratory testing to monitor the safety of continuous hormone therapy.

Gender reassignment surgery may be considered medically necessary when ALL of the following criteria are met:

- Age of majority in a given country. Note: WPATH guidelines address age of majority in a given country. For the purposes of this guideline, the age of majority is age 18. However, this refers to chronological age not biological age. Where approval or denial of benefits is based solely on the age of the individual a case-by-case medical director review is necessary.
- The individual is diagnosed as having a gender identity disorder (GID), including a diagnosis of transsexualism that includes ALL of the following criteria:
  - The individual has demonstrated the desire to live and be accepted as a member of the opposite sex, in addition to a desire to make his/her body as congruent as possible with the preferred sex through surgery and hormone replacement.
- The transsexual identity has been present consistently for at least two years.
- The disorder is not due to another mental disorder or chromosome abnormality.
- The individual is an active participant in a recognized gender identity treatment program and demonstrates **ALL** of the following conditions:
  - The individual has successfully lived and worked within the desired gender role full-time for at least 12 months (real life experience) without returning to the original gender.
  - One qualified health professional recommends initiation of hormonal therapy or breast surgery with written documentation submitted to the physician who will be responsible for the medical treatment.
  - The individual has received at least 12 months of continuous hormonal sex reassignment therapy, unless medically contraindicated.
  - A qualified mental health professional (a psychiatrist or Ph.D. clinical psychologist) recommends sex reassignment surgery with written documentation submitted to the physician performing the genital surgery (this should be an extensive report). The individual has undergone evaluation by the physician performing the genital surgery.

The following surgeries would be considered **medically necessary** when performed as part of a medically necessary initial gender reassignment:
- initial mastectomy/breast reduction
- hysterectomy
- salpingo-oophorectomy
- colpectomy
- metoidioplasty
- vaginoplasty
- colovaginoplasty
- orchiectomy
- penectomy
- clitoroplasty
- labiaplasty
- scrotoplasty
- urethroplasty
- phalloplasty
- testicular implants
- colovaginoplasty
- cenectomy
- clitoroplasty
- vulvoplasty
- penile skin inversion
- repair of introitus
- construction of vagina with graft, coloproctostomy
- urethromeatoplasty
**When Policy Topic is not covered**

When non-surgical treatments are not covered. Examples that apply to this exclusion include, but are not limited to:

- Reproduction services including, but not limited to: sperm preservation in advance of hormone treatment or gender dysphoria surgery, cryopreservation of fertilized embryos, oocyte preservation, surrogate parenting, donor eggs, donor sperm and host uterus. (See the Reproduction exclusion in the member specific benefit plan document.)
- Drugs* for hair loss or growth.
- Drugs* for sexual performance for patients that have undergone genital reconstruction.
- Drugs* for cosmetic purposes.
- Hormone therapy except as described in the Covered Services section above. Gender Dysphoria (Gender Identity Disorder)
- Voice therapy.

*The drugs exclusions listed above apply to drugs administered by a provider in a medical setting (including, but not limited to: office, outpatient, or inpatient facility). For drugs obtained at a pharmacy, the pharmacy benefit will apply.

The following associated gender reassignment surgeries are considered cosmetic in nature and not medically necessary, even in the presence of a benefit for gender reassignment surgery. These surgeries include, but are not limited to:

- breast augmentation/silicone injections of the breast
- blepharoplasty
- facial feminization surgery including facial bone reconstruction
- rhinoplasty
- lip reduction/enhancement
- face/forehead lift
- chin/nose implant or other facial implants
- trachea shave/reduction thyroid chondroplasty
- laryngoplasty
- liposuction
- electrolysis
- jaw shortening/sculpturing/facial bone reduction
- collagen injections
- removal of redundant skin
- voice modification surgery
- hair removal / hair transplantation
- abdominoplasty
- calf implants
- gluteal augmentation
- lipofilling collagen injections
- pectoral implants
- voice therapy
- construction of a clitoral hood
- mastopexy
- neck tightening
Considerations
Some grandfathered plans may exclude coverage of gender reassignment surgery (sex change surgery, transgender surgery) or any treatment of gender identity disorders. Please verify benefits.

Description of Procedure or Service
Gender reassignment surgery (also known as genital reconstruction surgery, sex affirmation surgery, or sex-change operation) is a term for the surgical procedures by which a person's physical appearance and function of their existing sexual characteristics are altered to resemble that of the other sex. It is part of a treatment for gender identity disorder/gender dysphoria in transsexual and transgender people. It may also be performed on intersex people, often in infancy. Other terms for this surgery include sex reassignment surgery, sex reconstruction surgery, genital reconstruction surgery, gender confirmation surgery, and more clinical terms, such as feminizing genitoplasty or penectomy, orchietomy and vaginoplasty are used medically for trans women, with masculinizing genitoplasty often similarly used for trans men.

Male to Female
In a series of staged procedures, the physician removes portions of the male genitalia and forms female external genitals. The penis is dissected and portions are removed with care to preserve vital nerves and vessels in order to fashion a clitoris-like structure. The urethral opening is moved to a position similar to that of a normal female. A vagina is made by dissecting and opening the perineum. This opening is lined using pedicle or split thickness grafts. Labia are created out of skin from the scrotum and adjacent tissue. A stent or obturator is usually left in place in the newly created vagina for three weeks or longer.

Female to Male
In a series of staged procedures, the physician forms a penis and scrotum using pedicle flap grafts and free skin grafts. Portions of the clitoris are used as well as the adjacent skin. Prostheses are often placed in the penis in order to have a sexually functional organ. Prosthetic testicles are fixed in the scrotum. The vagina is closed or removed.

Gender reassignment surgery is intended to be a permanent change to a patient's sexual identity and is not reversible. Therefore, a careful and accurate diagnosis is essential for treatment and can be made only as part of a long-term diagnostic process involving a multidisciplinary specialty approach that includes an extensive case history; gynecological, endocrinological and urological examination, and a clinical psychiatric/psychological examination. A patient’s self-assessment and desire for sex reassignment cannot be viewed as reliable indicators of GID.
Rationale
According to the World Professional Association for Transgender Health (WPATH) (formerly known as the Harry Benjamin International Gender Dysphoria Association [(HBIGDA)], Gender Identity Disorder (GID), more commonly known as transsexualism, is a condition recognized in the Diagnostic and Statistical Manual of Mental Disorders, (DSM-IV, 1994, and DSM-IV-TR, 2000) published by the American Psychiatric Association. Transsexualism is also recognized in the International Statistical Classification of Diseases and Related Health Problems, Ninth Revision, published by the World Health Organization, for which the United States is a signatory. The criteria listed for GID are descriptive of many people who experience dissonance between their sex as assigned at birth and their gender identity, which is developed in early childhood and understood to be firmly established by age 4, though for some transgender individuals, gender identity may remain somewhat fluid for many years. The DSM-IV descriptive criteria were developed to aid in diagnosis and treatment to alleviate the clinically significant distress and impairment know as gender dysphoria that is often associated with transsexualism.

Two frequently used methods of diagnosing transsexualism are the German Standards for the Treatment and Diagnostic Assessment of Transsexuals (Becker, et al., 1998) and the WPATH SOC (2001). According to these standards of care, transsexualism is identified as follows:
- a permanent and profound identification with the opposite sex
- a persistent feeling of discomfort regarding one’s biological sex or feelings of inadequacy in the gender role of that sex
- the wish to make his or her body as congruent as possible with the preferred sex through surgery and hormone replacement
- clinically relevant distress and/or impaired ability to function in social, work-related and other situations as a result of preoccupation with non-identification with the gender assigned at birth
- not a symptom of another mental disorder or a chromosomal abnormality
- persistent presence of the transsexual identity for at least two years

Mental health professionals play a strong role in working with individuals with GID, as they need to diagnose the gender disorder and any comorbid psychiatric conditions accurately, counsel the individual regarding treatment options, and provide psychotherapy and assess eligibility and readiness for hormone and surgical therapy. They usually provide documentation and formal recommendations to medical and surgical specialists. Psychiatric care may need to continue for several years after gender reassignment surgery, as major psychological adjustments may continue to be necessary. Other providers of care may include a family physician or internist, endocrinologist, urologist, plastic surgeon, general surgeon and gynecologist. The overall success of the surgery is highly dependent on psychological adjustment and continued support.
After diagnosis, the therapeutic approach usually includes three elements: hormones of the desired gender, real life experience in the desired role, and surgery to change the genitalia and other sex characteristics.

Prior to gender reassignment surgery, patients undergo hormone replacement therapy, which plays an important role in the gender transition process. Biological males can be treated with estrogens and anti-androgens to increase breast size, redistribute body fat, soften skin, decrease body hair, and decrease testicular size and erections. Biological females are treated with testosterone to deepen voice, increase muscle and bone mass, decrease breast size, increase clitoris size, and increase facial and body hair. Hormones must be administered by a physician and require ongoing medical management, including physical examination and lab studies to evaluate dosage, side effects, etc. Lifelong maintenance is usually required. Hormone therapy also limits fertility, and individuals need to be informed of sperm preservation options and cryopreservation of fertilized embryos prior to starting hormone therapy.

The individual identified with GID also undergoes what is called a “real life experience,” in which he/she adopts the new or evolving gender role and lives in that role as part of the transition pathway. This process tests the individual’s resolve and commitment for change, as well as the adequacy of his/her support system. During this time, a person would be expected to maintain full- or part-time employment, participate in community activities, acquire a legal gender identity appropriate first name, and provide an indication that others are aware of the change in gender role. Mental health professionals continue to play an important role in this individual's continuum of care.

**Transmen**
Transmen assume male gender identities or strive to present in more male gender roles. Gender reassignment surgery from female to male (FTM) includes surgical procedures that reshape a female body into the appearance of a male body. Procedures often performed as part of gender reassignment surgery of FTM include mastectomy, hysterectomy, salpingo-oophorectomy, colpectomy (i.e., removal of the vagina) and metoidioplasty (i.e., construction of a penis).

**Transwomen**
Transwomen strive for a female identity. Gender reassignment surgery from male to female (MTF) includes procedures that shape a male body into the appearance of and, to the maximum extent possible, the function of a female body. Procedures often performed as part of gender reassignment surgery of MTF include vaginoplasty, penile inversion to create a vagina and clitoris, penectomy, colovaginoplasty (i.e., creation of vagina from sigmoid colon), breast augmentation, orchiectomy, clitoroplasty and labiaplasty.

**Professional Society/Organization**
In 2009 the Endocrine Society published a clinical practice guideline for endocrine treatment of transsexual persons (Hembree, et al., 2009). As part of this guideline, the endocrine society recommends that transsexual persons consider
genital sex reassignment surgery only after both the physician responsible for endocrine transition therapy and the mental health professional find surgery advisable; that surgery be recommended only after completion of at least one year of consistent and compliant hormone treatment; and that the physician responsible for endocrine treatment medically clear the individual for sex reassignment surgery and collaborate with the surgeon regarding hormone use during and after surgery.

**Summary**

Sex reassignment surgical procedures for diagnosed cases of GID should be recommended only after a comprehensive evaluation by a qualified mental health professional. The surgeon should have a demonstrated competency and extensive training in sexual reconstructive surgery. Long-term follow-up is highly recommended for the enduringly successful outcome of surgery.
